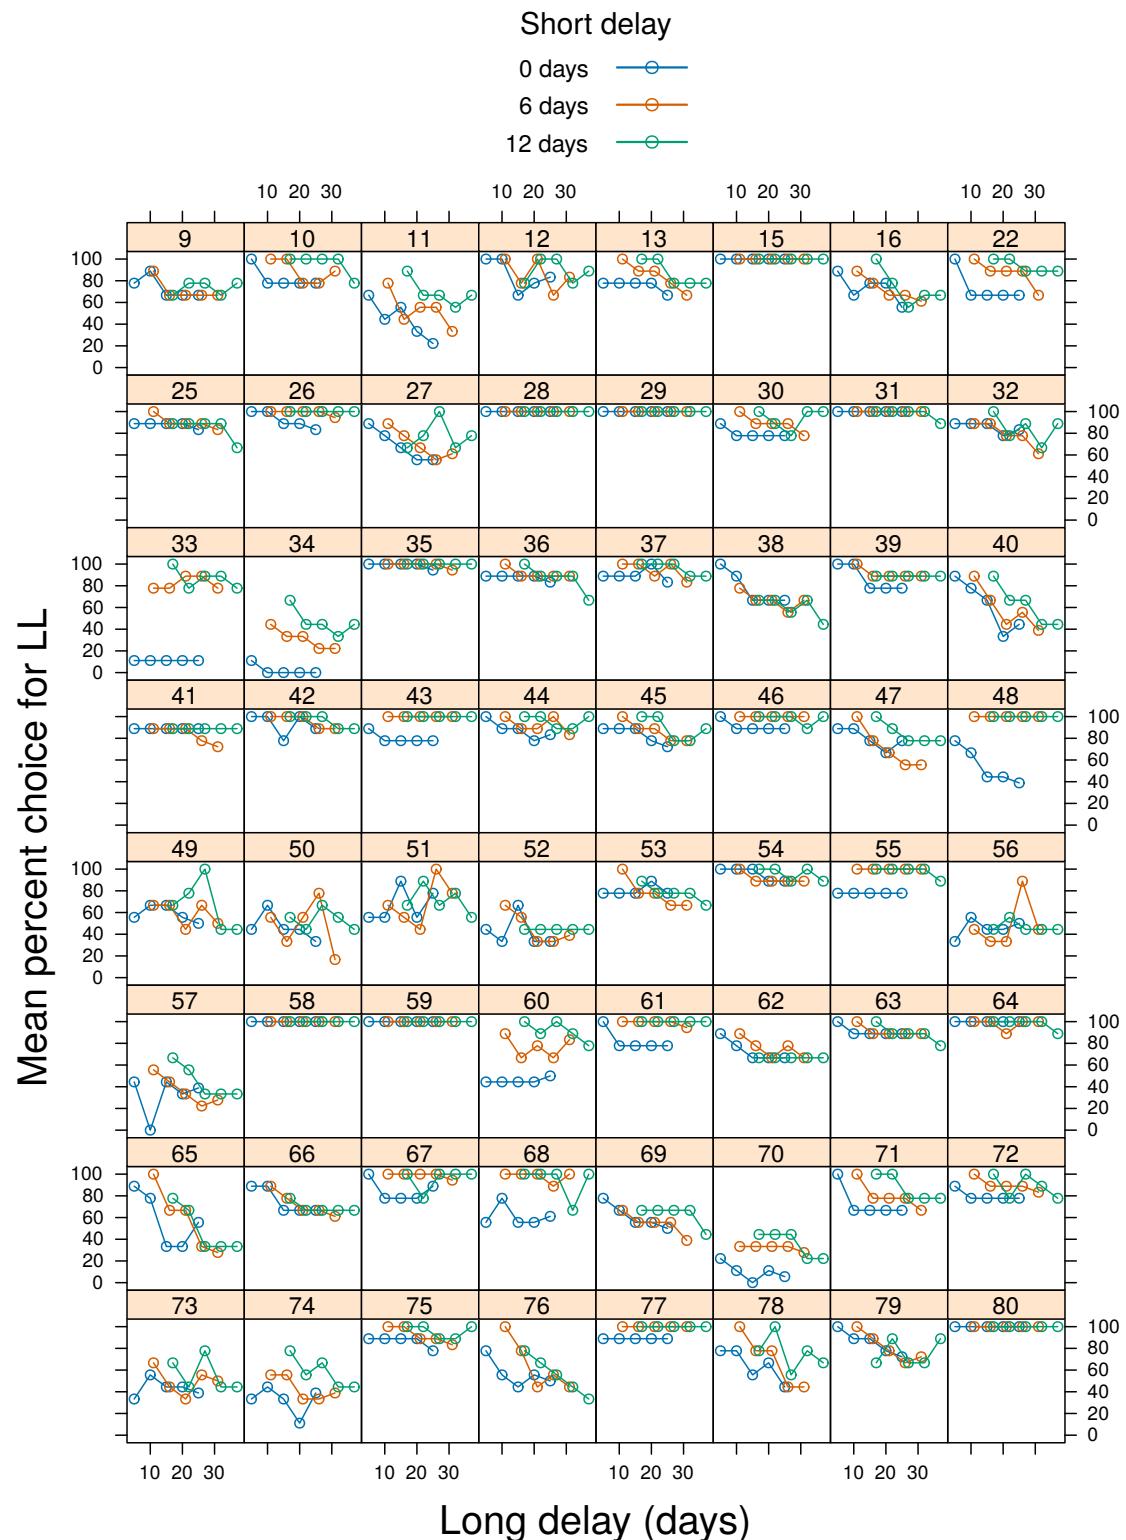

Figure S1. Mean choice percentages for staircase data in Experiment 1. Participants experienced three short delays and five long delays in the staircase phase of Experiment 1.

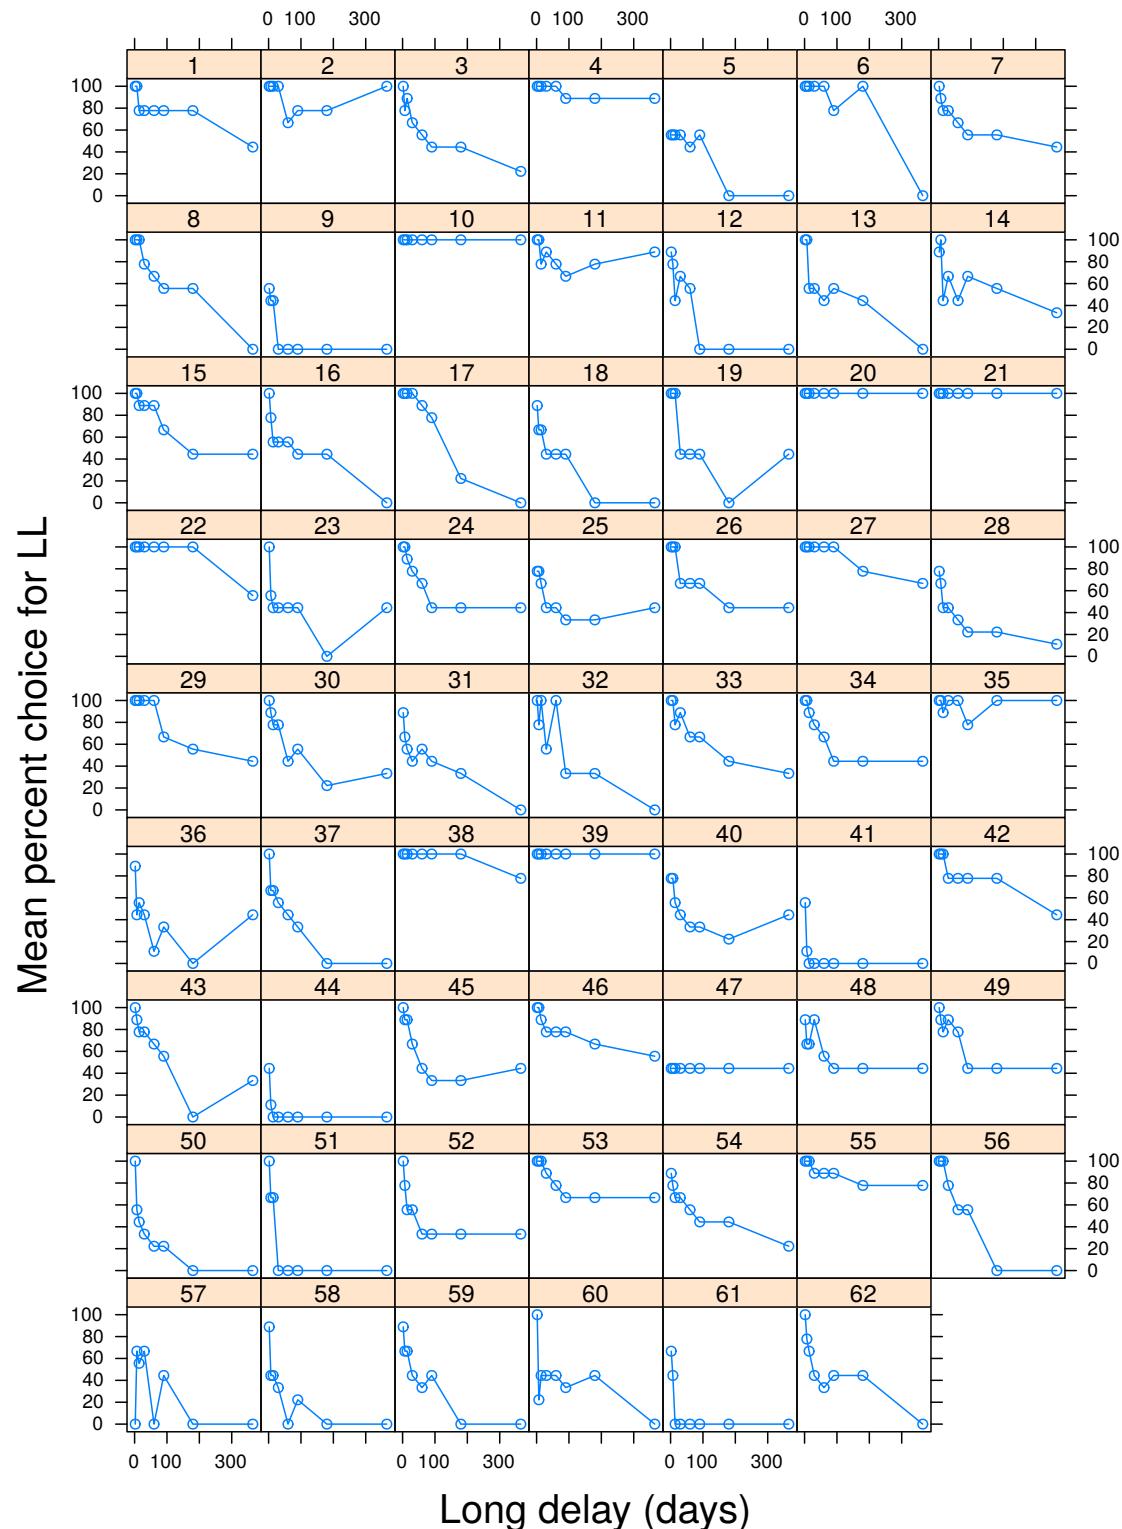

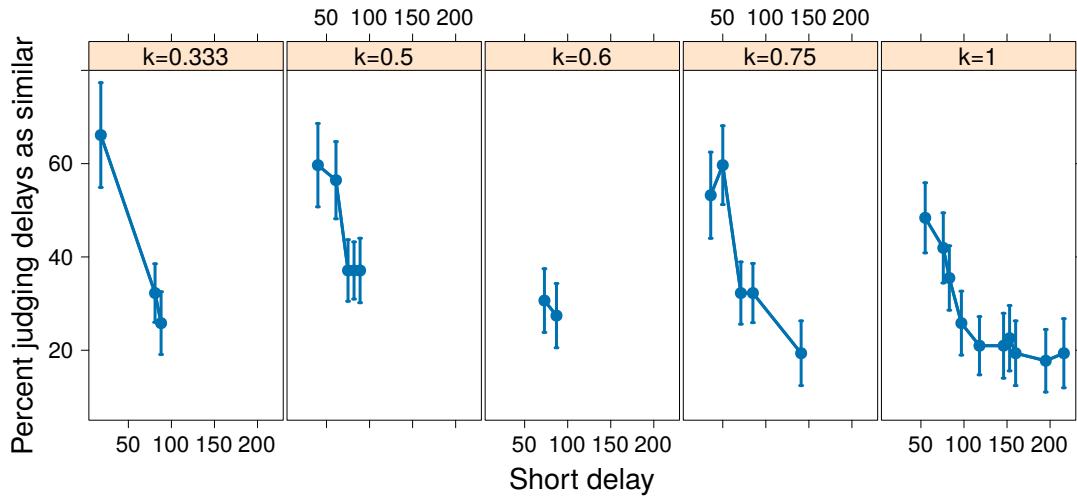

Figure S2. Mean choice percentages for staircase data in Experiment 2. Participants experienced eight long delays in the staircase phase of Experiment 2.

(a)

(b)

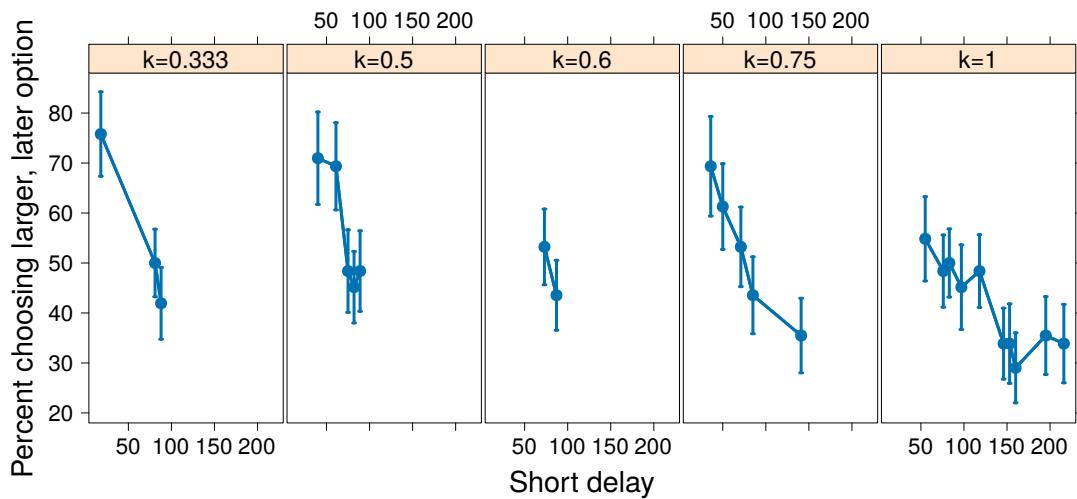

Figure S3. Tests effect of delay in Experiment 2. Each panel represents a block of questions with same k parameter at indifference. (a) The percentage of participants who rated the delays as similar decreased as the short delay magnitude increased. (b) Choice for the larger, later option in the binary choices decreased with the short delay magnitude. Points and error bars represent means and within-subjects 95% confidence intervals.

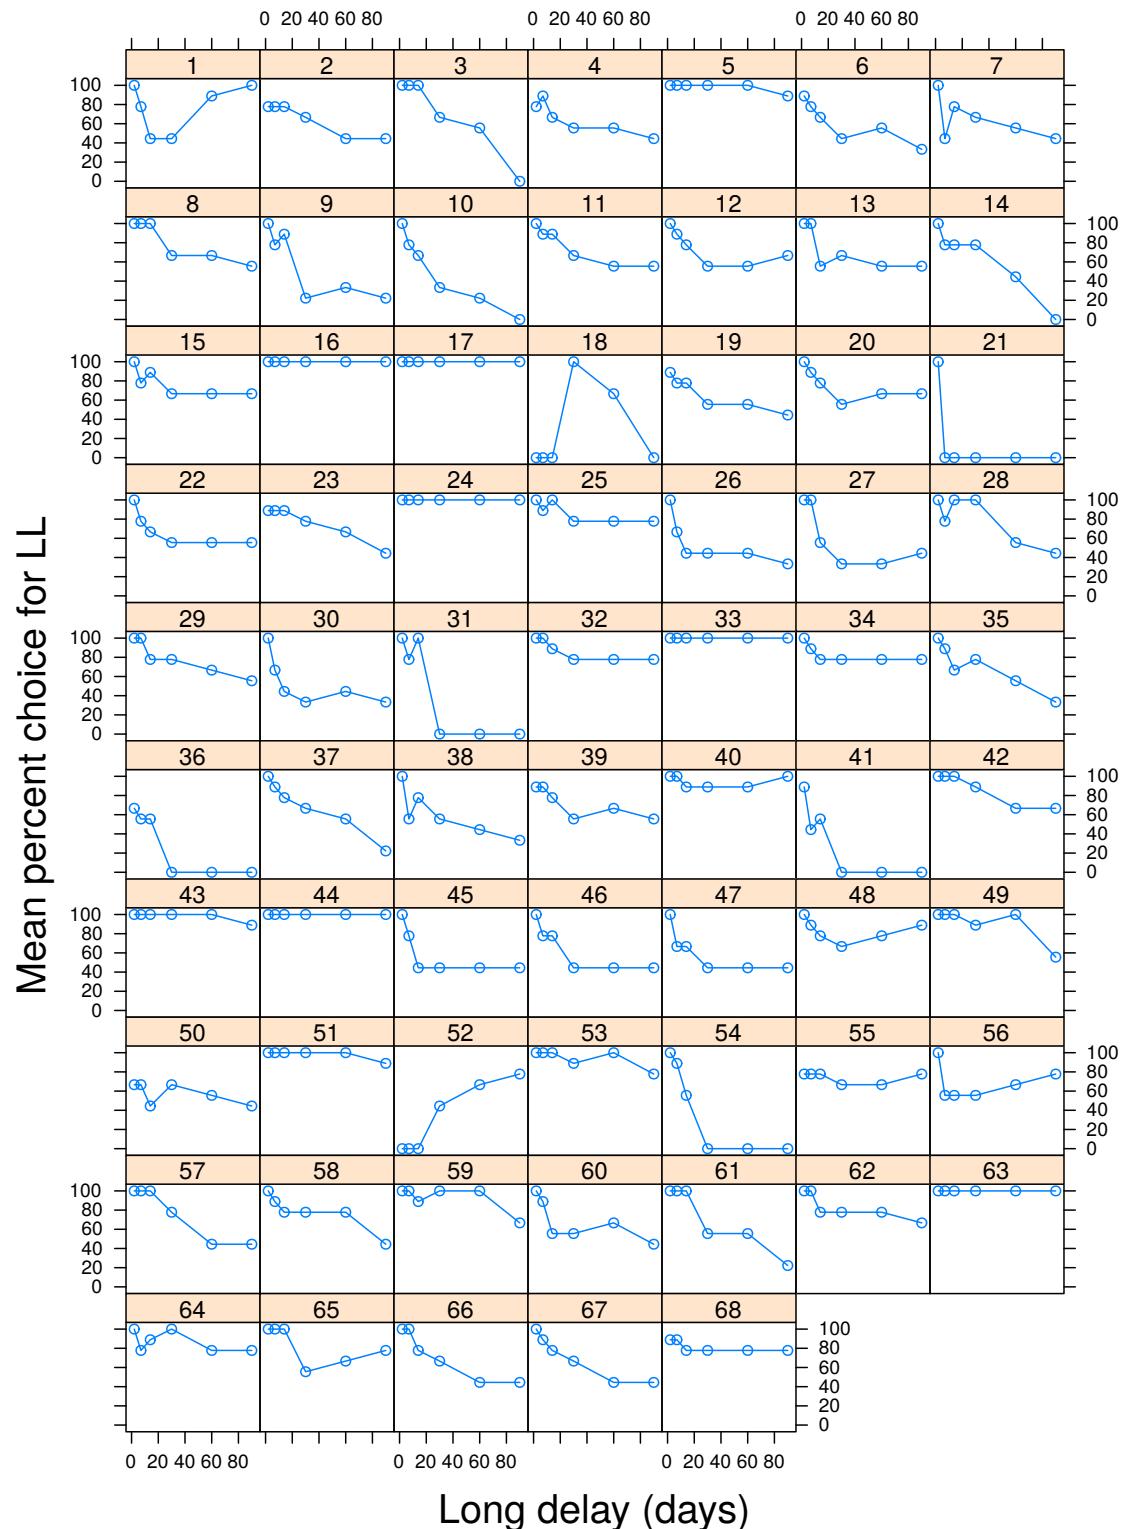

Figure S4. Choice percentages for staircase data in Experiment 3 gain condition. Participants experienced six long delays in the staircase phase of Experiment 3.

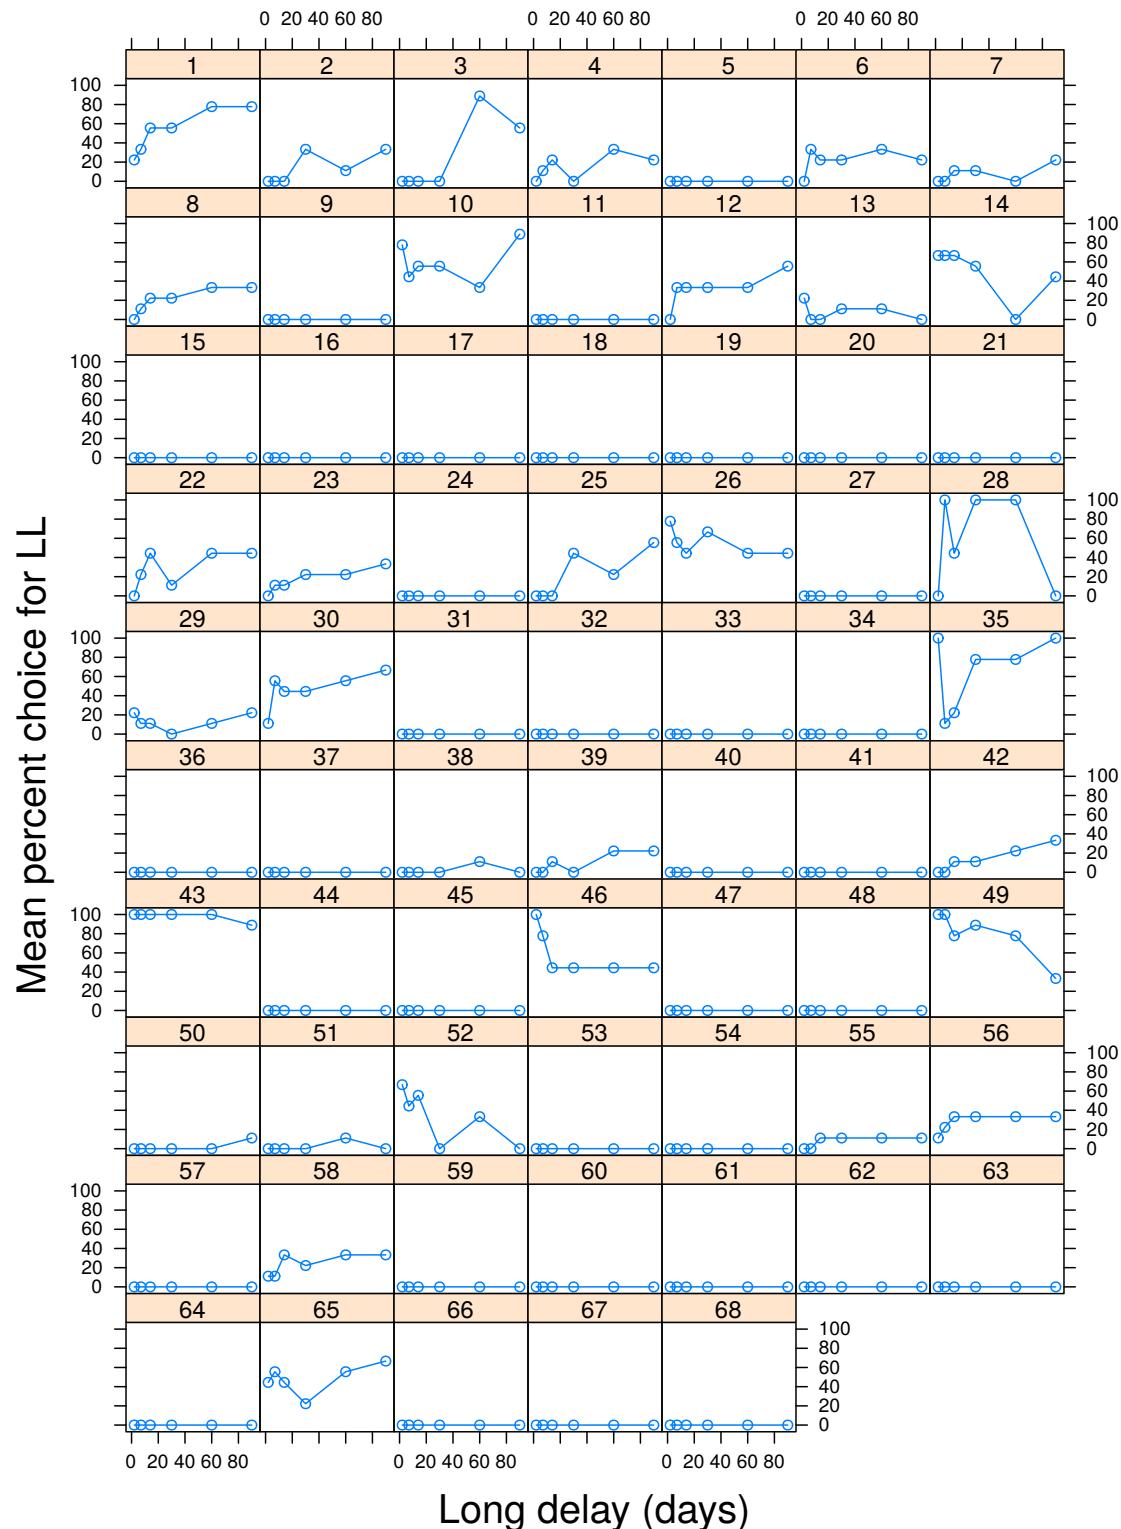

Figure S5. Choice percentages for staircase data in Experiment 3 loss condition. Participants experienced six long delays in the staircase phase of Experiment 3.
